

Complete Notes on Python: Definition, Features and Applications

What is Python?

Python is a high-level, interpreted, general-purpose programming language used for developing software, websites, automation scripts, data analysis, artificial intelligence, and many other applications.

Python was created by Guido van Rossum and first released in 1991. It is designed to be simple, readable, and easy to learn.

Definition:

Python is a programming language that allows developers to write instructions for computers using a simple and human-readable syntax.

Example:

```
print("Hello, World!")
```

Output:

Hello, World!
